

Science Revolutions DSCY10020

This module considers historical aspects of modern science with an emphasis on our changing view of the universe, from the astronomy of the ancient Greeks to Galileo's battle with the Church, from Newton's universal law of gravity to Einstein's relativity and the 'big bang' model of the cosmos. The theory of evolution, the treatment of women in research and the role of perspective in the writing of history will also feature in the module.
